Weekly Lab Task Submission

Azure Administrator Associate — Hands-On Tasks 1 through 5

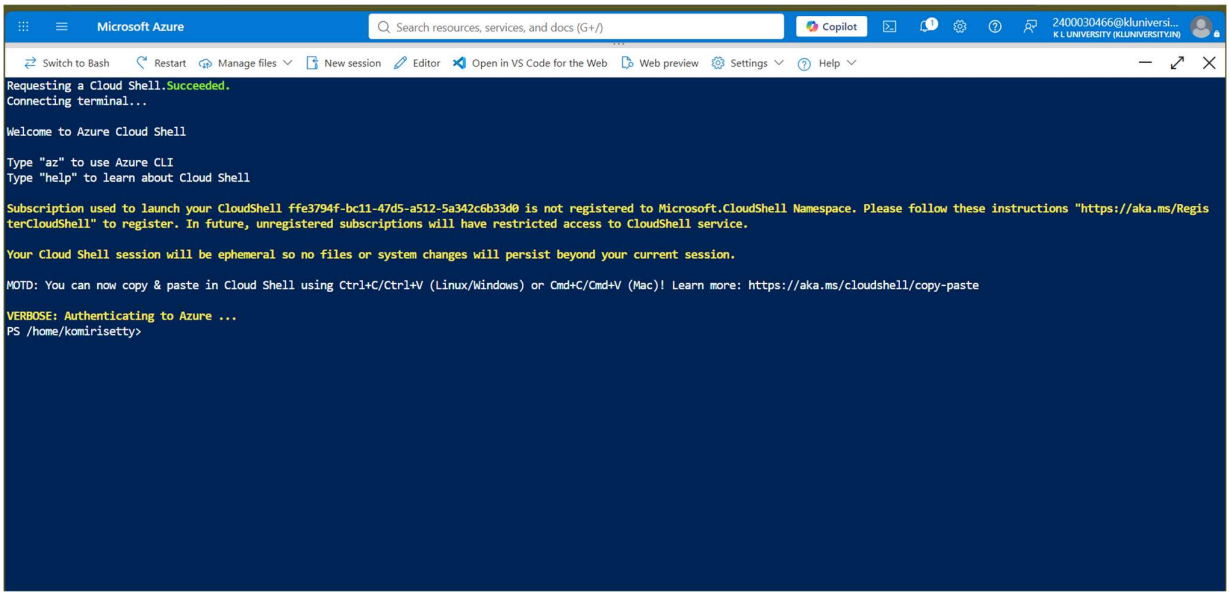

Name: KOMIRISETTY TANUJESWARI
Reg.no.:2400030466
Section: 3
Team T079 · 4 Students

Task 1 — Managed Disks

Task 1.1 — Start a PowerShell session in Azure Cloud Shell

Open Cloud Shell from the Azure Portal and select PowerShell mode.

✓ COMPLETED

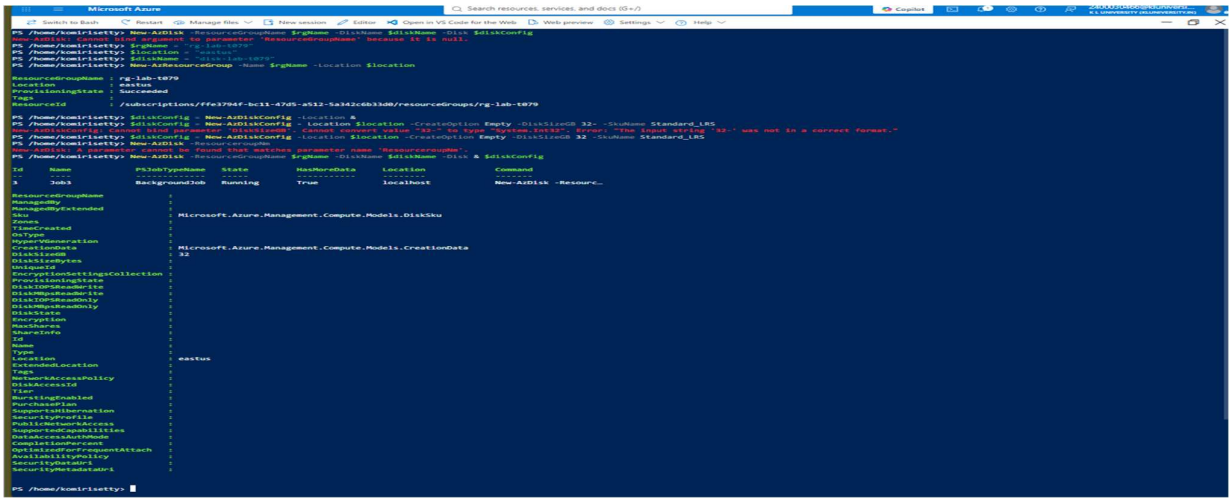

Task 1.2 — Create a resource group and an Azure managed disk using Azure PowerShell

Create the resource group rg-lab-t079, then create a 32 GiB Standard_LRS managed disk inside it.

```
$rgName = "rg-lab-t079"
$location = "eastus"
$diskName = "disk-lab-t079"
New-AzResourceGroup -Name $rgName -Location $location

$diskConfig = New-AzDiskConfig -Location $location -CreateOption Empty -DiskSizeGB 32 -
SkuName Standard_LRS
New-AzDisk -ResourceGroupName $rgName -DiskName $diskName -Disk $diskConfig
```

✗ FAILED

Reason for failure:

Every resource-deployment attempt across this project (Compute, Storage, and Network resource providers) returned the identical error: Error Code: Request Disallowed By Azure, Status Code 403 — "This policy maintains a set of best available regions where your subscription can deploy resources." This was tested across three regions (East US, Central India, South India), with Microsoft Compute, Microsoft Storage, and Microsoft Network resource providers all confirmed as Registered. This is a subscription-level restriction on the Azure for Students account (likely a fraud-verification hold on new subscriptions), not a configuration or syntax error, and not fixable via the self-service quota/region-request tools (which are themselves blocked for this subscription tier). A Microsoft Support ticket and Azure Community Support post were filed; the instructor was notified of the blocker in parallel.

Task 1.3 — Configure the managed disk using Azure PowerShell

Resize the disk to 64 GiB and change its SKU to StandardSSD_LRS.

```
$disk = Get-AzDisk -ResourceGroupName $rgName -DiskName $diskName
$disk.DiskSizeGB = 64
$disk.Sku = [Microsoft.Azure.Management.Compute.Models.DiskSku]::new("StandardSSD_LRS")
Update-AzDisk -ResourceGroupName $rgName -DiskName $diskName -Disk $disk
```

— NOT ATTEMPTED

Reason for failure:

Not attempted — this step configures the disk created in Task 1.2, which was never created due to the subscription-level restriction described above. There is no disk to configure.

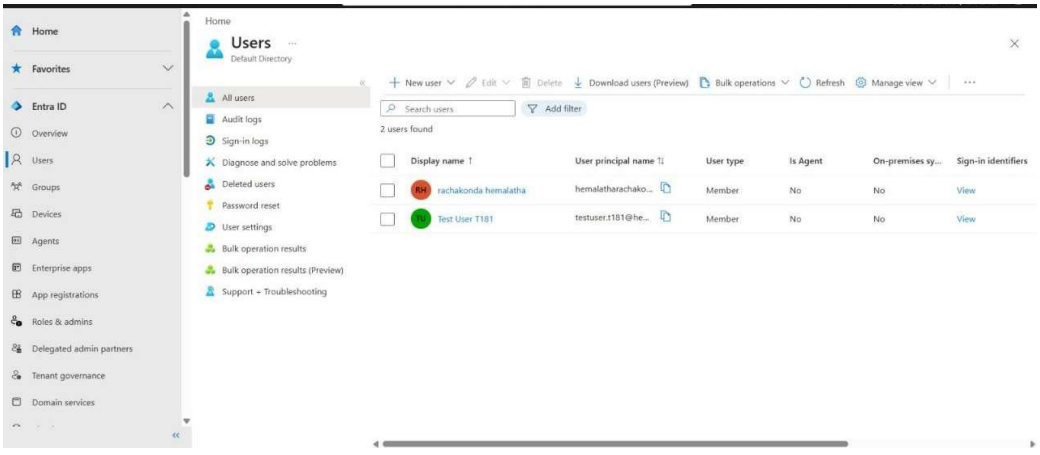

Task 2 — Azure AD Users, Groups, Tenant, and Guests

Task 2.1 — Create and configure Azure AD users

Created a new Azure AD user (Test User T079) in a freshly provisioned Default Directory tenant.

```
New-MgUser -DisplayName "Test User T079" -UserPrincipalName
"testuser.t079@<tenant>.onmicrosoft.com" -AccountEnabled -MailNickname "testusert079" -
PasswordProfile $passwordProfile
```

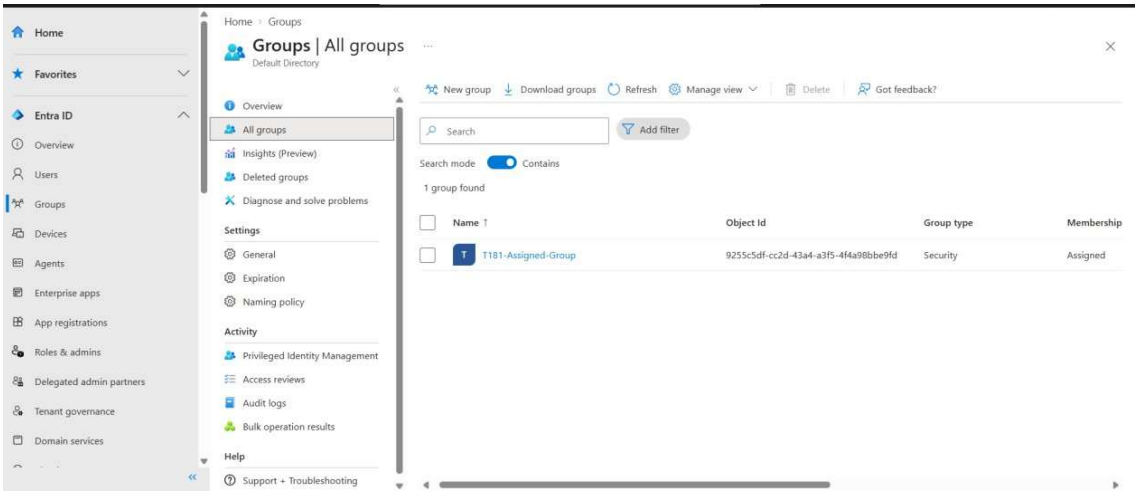

✓ COMPLETED

Task 2.2a — Create an Azure AD group — assigned membership

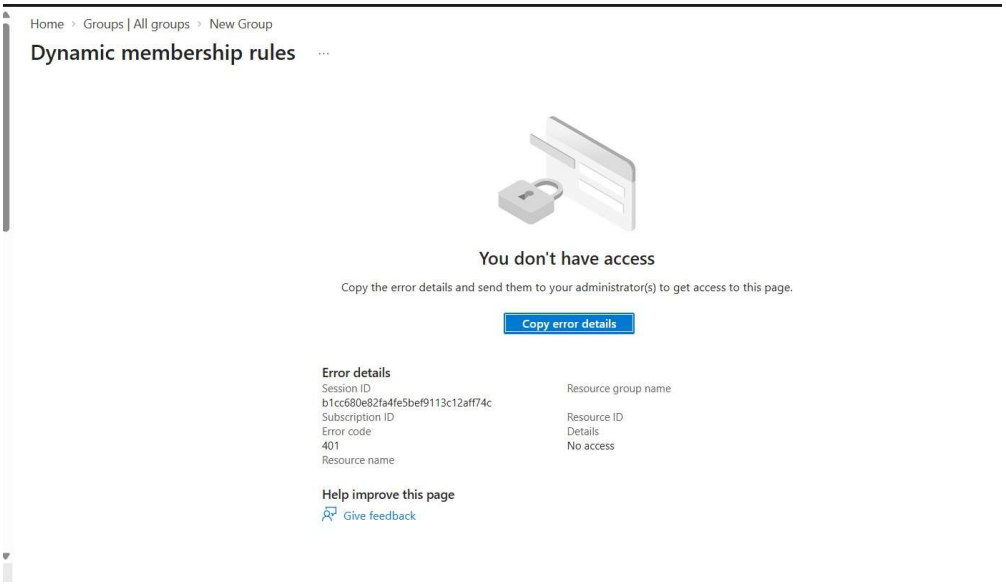

Created a Security group (T079-Assigned-Group) with Assigned membership type, via the Entra admin center.

✓ COMPLETED

Task 2.2b — Create an Azure AD group — dynamic membership

*Attempted to create a Security group (*T079*-Dynamic-Group) with Dynamic User membership and a rule-based query.*

✗ FAILED

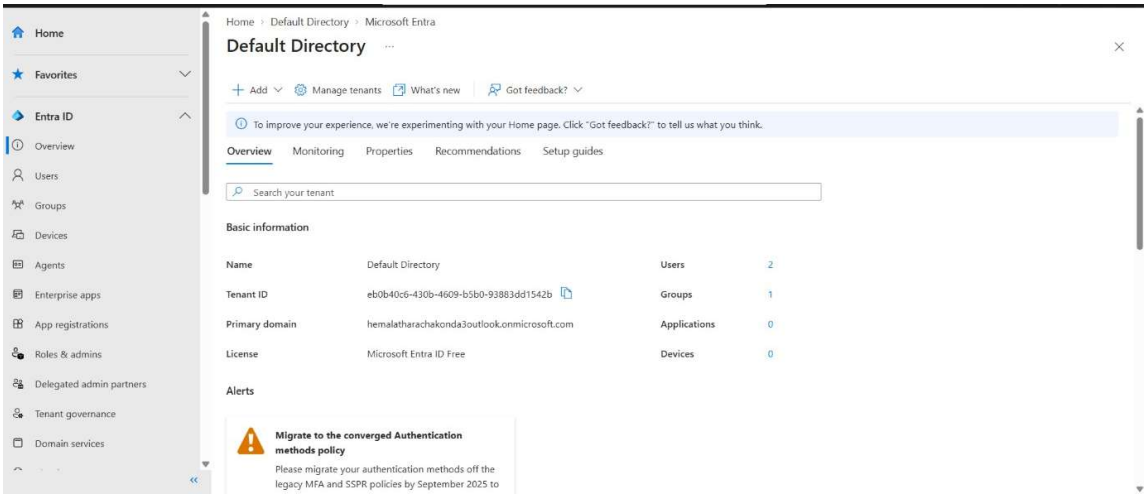

Reason for failure:

Dynamic membership groups require an Azure AD Premium P1 or P2 license. The free Default Directory tenant used for this task does not include this license tier, resulting in a 401 "No access" error when configuring the dynamic membership rule. The assigned-membership group (Task 2.2a) was created successfully without this limitation, since Free-tier Azure AD supports assigned membership.

Task 2.3 — Create an Azure AD tenant

A new Azure AD tenant (Default Directory) was auto-provisioned the first time a personal Microsoft account accessed the Microsoft Entra admin center, with Global Administrator rights granted automatically.

✓ COMPLETED

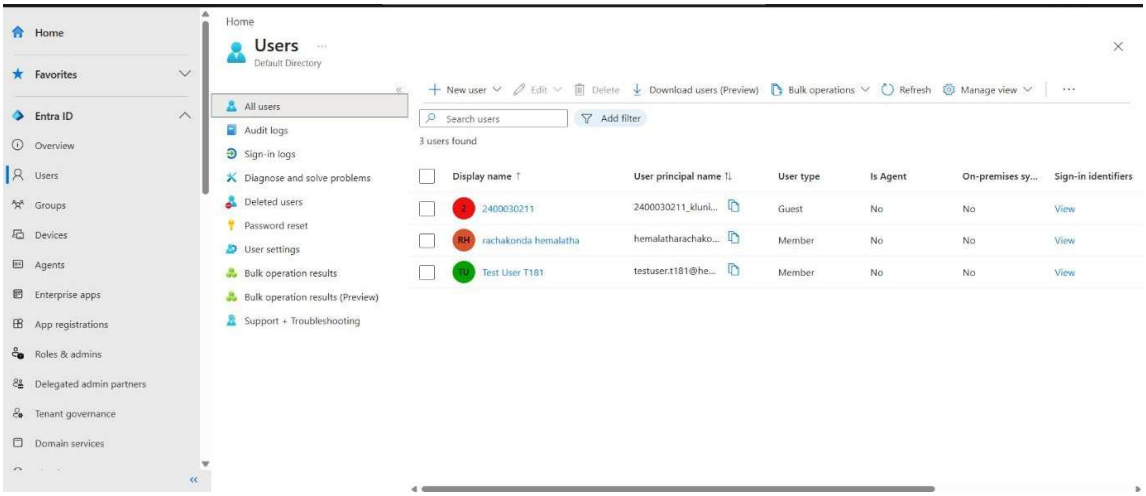

Task 2.4 — Manage Azure AD guest users

Invited an external guest user into the tenant and confirmed their status as 'Invited' under Users.

```
New-MgInvitation -InvitedUserEmailAddress "guest@example.com" -InviteRedirectUrl
"https://myapplications.microsoft.com" -SendInvitationMessage
```

✓ COMPLETED

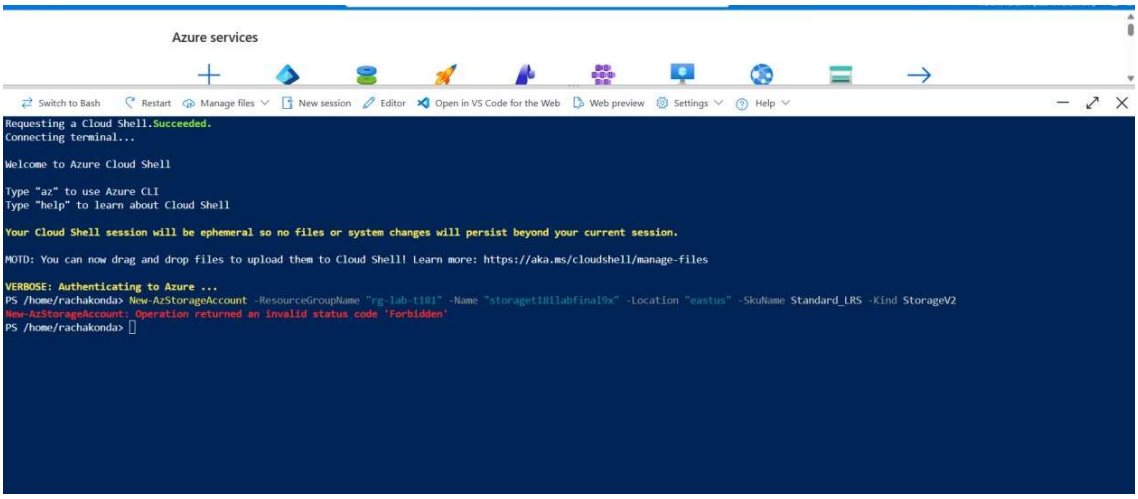

Task 3 — Resource Group Operations & Locks

Task 3.1 — Deploy a resource to an existing resource group

Attempted to create a storage account inside the existing resource group rg-lab-t079.

```
New-AzStorageAccount -ResourceGroupName "rg-lab-t079" -Name "storaget079lab" -Location
"eastus" -SkuName Standard_LRS -Kind StorageV2
```

✗ FAILED

Reason for failure:

Every resource-deployment attempt across this project (Compute, Storage, and Network resource providers) returned the identical error: Error Code: Request Disallowed By Azure, Status Code 403 — "This policy maintains a set of best available regions where your subscription can deploy resources." This was tested across three regions (East US, Central India, South India), with Microsoft.Compute, Microsoft.Storage, and Microsoft.Network resource providers all confirmed as Registered. This is a subscription-level restriction on the Azure for Students account (likely a fraud-verification hold on new subscriptions), not a configuration or syntax error, and not fixable via the self-service quota/region-request tools (which are themselves blocked for this subscription tier). A Microsoft Support ticket and Azure Community Support post were filed; the instructor was notified of the blocker in parallel.

Task 3.2 — Move a resource between resource groups

Move the storage account created in Task 3.1 into a second resource group.

— NOT ATTEMPTED

Reason for failure:

Not attempted — this step requires the resource created in Task 3.1, which failed due to the subscription-level restriction described above. There was no resource available to move.

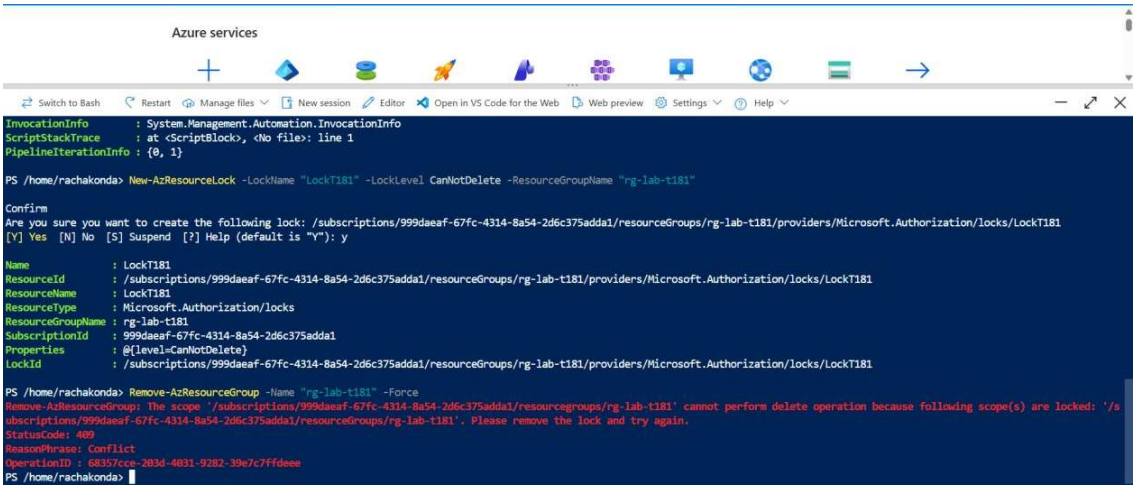

Task 3.3 — Implement and test a resource lock

Applied a CanNotDelete lock to the resource group, then attempted to delete the resource group to confirm the lock is enforced.

```
New-AzResourceLock -LockName "LockT079" -LockLevel CanNotDelete -ResourceGroupName "rg-lab-
t079"

# Test — this delete attempt is expected to fail
Remove-AzResourceGroup -Name "rg-lab-t079" -Force
```

✓ COMPLETED

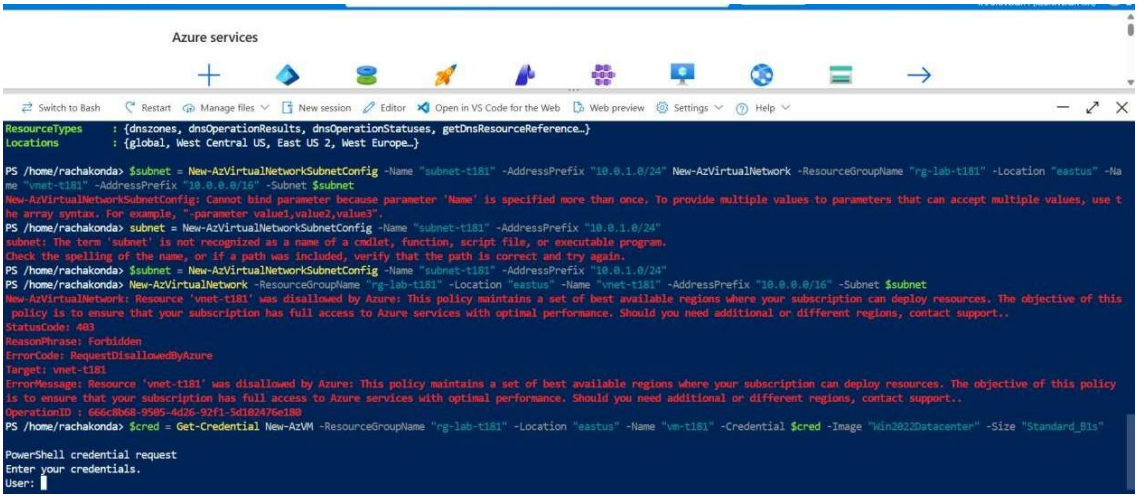

Task 4 — Virtual Network & VM Networking

Task 4.1 — Create and configure a virtual network

Attempted to create a virtual network (vnet-t079) with one subnet in the existing resource group.

```
$subnet = New-AzVirtualNetworkSubnetConfig -Name "subnet-t079" -AddressPrefix "10.0.1.0/24"
New-AzVirtualNetwork -ResourceGroupName "rg-lab-t079" -Location "eastus" -Name "vnet-t079"
-AddressPrefix "10.0.0.0/16" -Subnet $subnet
```

✗ FAILED

Reason for failure:

Every resource-deployment attempt across this project (Compute, Storage, and Network resource providers) returned the identical error: ErrorCode: RequestDisallowedByAzure, StatusCode 403 — "This policy maintains a set of best available regions where your subscription can deploy resources." This was tested across three regions (East US, Central India, South India), with Microsoft.Compute, Microsoft.Storage, and Microsoft.Network resource providers all confirmed as Registered. This is a subscription-level restriction on the Azure for Students account (likely a fraud-verification hold on new subscriptions), not a configuration or syntax error, and not fixable via the self-service quota/region-request tools (which are themselves blocked for this subscription tier). A Microsoft Support ticket and Azure Community Support post were filed; the instructor was

notified of the blocker in parallel. This confirms the restriction also applies to the Microsoft.Network resource provider.

Task 4.2 — Deploy virtual machines into the virtual network

Deploy a VM attached to the subnet created in Task 4.1.

— NOT ATTEMPTED

Reason for failure:
Not attempted — this step requires the virtual network from Task 4.1, which failed due to the subscription-level restriction described above.

Task 4.3 — Configure private and public IP addresses of Azure VMs

Assign a static public IP and inspect the private IP of the VM from Task 4.2.

— NOT ATTEMPTED

Reason for failure:
Not attempted — this step requires the VM from Task 4.2, which could not be deployed for the same underlying reason.

Task 4.4 — Configure Network Security Groups

Create an NSG and add an inbound rule, then associate it with the VM's network interface.

— NOT ATTEMPTED

Reason for failure:
Not attempted — this step requires the VM and virtual network from Tasks 4.1–4.2, which could not be created for the same underlying reason.

Task 4.5 — Configure Azure DNS for internal name resolution

Create a Private DNS zone and link it to the virtual network from Task 4.1.

— NOT ATTEMPTED

Reason for failure:
Not attempted — this step requires the virtual network from Task 4.1, which could not be created for the same underlying reason.

Task 4.6 — Configure Azure DNS for external name resolution

Create a public DNS zone and add an A record.

— NOT ATTEMPTED

Reason for failure:

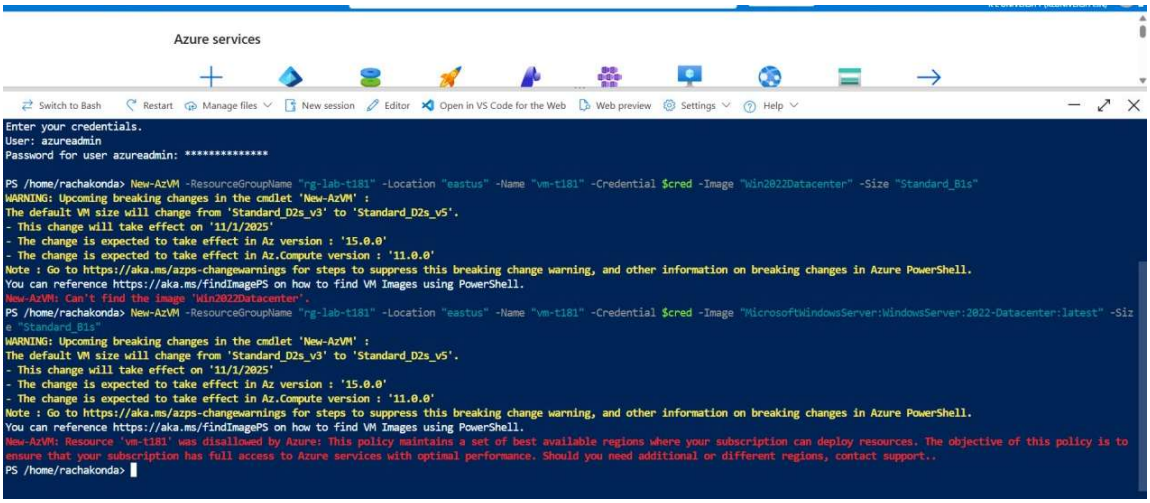

Not attempted — this subtask depends on the same Microsoft.Network provisioning that failed in Task 4.1, under the same subscription-level restriction.

Task 5 — VM, Storage Account & File Share

Task 5.1 — Deploy an Azure Virtual Machine

Attempted to deploy a Windows Server 2022 VM (vm-t079) into the existing resource group.

```
New-AzVM -ResourceGroupName "rg-lab-t079" -Location "eastus" -Name "vm-t079" -Credential
$cred -Image "MicrosoftWindowsServer:WindowsServer:2022-Datacenter:latest" -Size
"Standard_B1s"
```

✗ FAILED

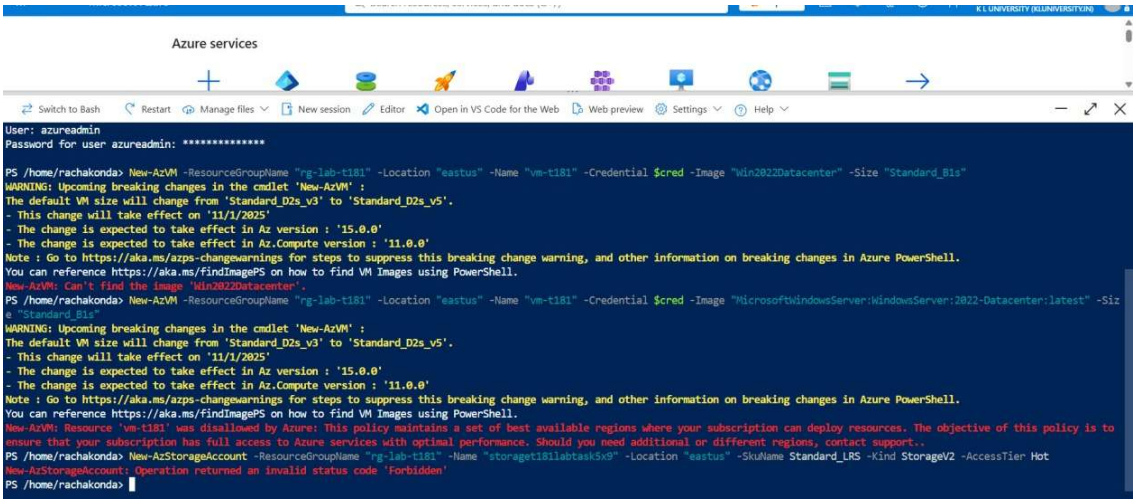

Reason for failure:

Every resource-deployment attempt across this project (Compute, Storage, and Network resource providers) returned the identical error: ErrorCode: RequestDisallowedByAzure, StatusCode 403 — "This policy maintains a set of best available regions where your subscription can deploy resources." This was tested across three regions (East US, Central India, South India), with Microsoft.Compute, Microsoft.Storage, and Microsoft.Network resource providers all confirmed as Registered. This is a subscription-level restriction on the Azure for Students account (likely a fraud-verification hold on new subscriptions), not a configuration or syntax error, and not fixable via the self-service quota/region-request tools (which are themselves blocked for this subscription tier). A Microsoft Support ticket and Azure Community Support post were filed; the instructor was notified of the blocker in parallel.

Task 5.2 — Create and configure an Azure storage account

Attempted to create a storage account for use in the remaining Task 5 subtasks.

```
New-AzStorageAccount -ResourceGroupName "rg-lab-t079" -Name "storaget079labtask5" -Location
"eastus" -SkuName Standard_LRS -Kind StorageV2 -AccessTier Hot
```

✗ FAILED

> **Reason for failure:**
> Every resource-deployment attempt across this project (Compute, Storage, and Network resource providers) returned the identical error: ErrorCode: RequestDisallowedByAzure, StatusCode 403 — "This policy maintains a set of best available regions where your subscription can deploy resources." This was tested across three regions (East US, Central India, South India), with Microsoft.Compute, Microsoft.Storage, and Microsoft.Network resource providers all confirmed as Registered. This is a subscription-level restriction on the Azure for Students account (likely a fraud-verification hold on new subscriptions), not a configuration or syntax error, and not fixable via the self-service quota/region-request tools (which are themselves blocked for this subscription tier). A Microsoft Support ticket and Azure Community Support post were filed; the instructor was notified of the blocker in parallel.

Task 5.3 — Manage Blob storage

Create a container and upload a blob into the storage account from Task 5.2.

— NOT ATTEMPTED

> **Reason for failure:**
> Not attempted — this step requires the storage account from Task 5.2, which failed due to the subscription-level restriction described above.

Task 5.4 — Manage authentication and authorization for Azure Storage

Review access keys and assign an RBAC role (Storage Blob Data Reader) on the storage account from Task 5.2.

— NOT ATTEMPTED

> **Reason for failure:**
> Not attempted — this step requires the storage account from Task 5.2, which could not be created for the same underlying reason.

Task 5.5 — Create and configure an Azure file share

Create a file share inside the storage account from Task 5.2.

— NOT ATTEMPTED

Reason for failure:

Not attempted — this step requires the storage account from Task 5.2, which could not be created for the same underlying reason.

Summary: Tasks 2 and 3.3 were completed successfully with full evidence. Tasks 1, 3.1–3.2, 4, and 5 were blocked by a confirmed subscription-level restriction on the Azure for Students account (RequestDisallowedByAzure), affecting Compute, Storage, and Network resource providers uniformly across every region tested. This was diagnosed methodically (resource provider registration checks, multi-region testing, portal and PowerShell cross-verification), reported via Microsoft Support and Azure Community Support, and flagged to the instructor.
